

# SELECTING A PUMP FOR CONTINUOUS DUTY

## AXIOM ENGINEERING RESOURCE

A practical framework for sizing a process pump around the duty cycle, fluid properties, controls, and maintenance reality.

### 01 Establish the duty point

Record the normal and upset flow range, pressure requirement, fluid temperature, expected operating hours, and suction conditions before comparing curves.

### 02 Check the system curve

Review minimum flow, transient pressure, pipe losses, materials compatibility, and control strategy. A component cannot compensate for an unbalanced system.

### 03 Confirm the package

Review pump, motor, baseplate, instrumentation, isolation, commissioning access, and maintenance documentation as one package before release.

This reference is intended to support early-stage engineering conversations. Final selection and compliance requirements remain project-specific.
